

AMC MINERALS STICK UP

STICK UP quickly seals lost circulation zones, keeping drill rigs turning and minimising downtime spent stabilising formations.

STICK UP is a specialized synthetic micro-emulsion that will improve productivity and reduce lost circulation in highly porous formations.

The product reacts instantly with water, allowing it to penetrate the surrounding pores, spaces and fractures to cure instability and eliminate lost circulation.

STICK UP can be used to fuse unconsolidated formations or to regain circulation when conventional lost circulation materials fail to perform. STICK-UP is a rapid fill material specially engineered to consolidate and seal highly porous formations.

Where cavernous, vugular and highly fractured formations are encountered, or where cements or other lost circulation materials are unproductive, STICK UP is extremely effective in reducing lost circulation.

STICK-UP can be also used where a squeeze plug would be beneficial to shut off water flows to stabilise gravel sections and is particularly advantageous where the loss of the whole drilling fluid system is prevalent.

Pouring STICK UP into the rod string.

STICK UP can achieve 100% returns to keep the hole advancing.

KEY BENEFITS

- ◆ Reacts instantly after contact with water
- ◆ Consolidates sands, gravels and fractured formations
- ◆ Addresses lost circulation in cavernous, vugular formations
- ◆ Tolerates high temperature and high pressure
- ◆ Compatible with other lost circulation materials
- ◆ Improves productivity
- ◆ Environmentally acceptable
- ◆ 30 minute curing time.
